# SECURE CLOUD INTERCONNECT

Secure, reliable and scalable connections from devices directly to market leading cloud providers in major data centers around the world.

Private IP uses secure, diverse, dynamically scaling, fully redundant connections up to 10GigE.

## MOVE TO THE CLOUD WITH CONFIDENCE

Your customers want to access their data from wherever their employees happen to be, but they have reservations about security compliance on the cloud. Verizon's Secure Cloud Interconnect (SCI) allows you to connect them safely to their cloud based applications via a large cadre of cloud providers using our advanced network services.

SCI works in tandem with our Private IP Network. A virtual private network, Private IP uses secure, diverse, dynamically scaling, fully redundant connections up to 10GigE to link your customers' business applications with their infrastructure, platform and business process cloud providers.

What the service includes:

- Multiple high-speed, diverse interconnections to market leading cloud providers in major data centers located in North and South America, Europe and Asia Pacific
- Secure interconnections from the customer Private IP network to cloud providers using firewalls, encryption, and integration
- A single portal that instantly connects the customer network to the cloud providers to allow for management of cloud services
- Usage-based billing
- Classes of service and stringent SLAs

## SECURE, RELIABLE ACCESS

SCI doesn't just provide secure, reliable access to major cloud providers. Because the service runs through our Private IP network, no additional access lines are required; there is faster turn-up and the integration is seamless, saving your customers time and money.  In addition, we offer usage-based billing to help track and control costs.

Secure Cloud Interconnect is built on one of the world's largest global IP networks, with 24x7 customer service and competitive service level agreements.
