Carrier-Grade Network Delivers a Superior Connectivity Service

Our Natural Wireless engineering team architected a carrier-grade network, utilizing multiple redundant multi-Gigabit Fixed Wireless Fiber connections, to deliver a superior connectivity service.

The comprehensive network design is based on Multiprotocol Label Switching (MPLS) core and access approach, providing the highest levels of Quality of Service (QoS), security, and reliability.

Multiple Multi-Gigabit Connections Ensure Full Redundancy And Diverse Tier 1 Upstream Access

To achieve full redundancy for the core network utilizing the any-to-any routing, each base station, which facilitates communication between the end user LAN and the core, is connected to the rest of the network via multiple multi-Gigabit connections, utilizing high-capacity microwave backhaul technology.

We have created multiple redundant multi-Gigabit connections for diverse tier 1 upstream access across the Fixed Wireless Fiber network.
