

## Vista™ + App Xchange

### Key Features

- **Close jobs faster.** POs, invoices, and change orders flow into Vista automatically via secure API.
- **Stop reconciling, start reviewing.** Per-record batch reporting tells you exactly what landed in Vista and what didn't.
- **Catch problems early.** Pre-export validation flags errors before the data ever leaves Remarcable.
- **Fix it once, in one place.** In-line editing means corrections happen on the screen you're already on - no rework.
- **Multi-destination sync.** Push data to Vista and your project management software in a single action.
- **Tax and Vendor discount mapping.** Configurable rules handle your real-world AP scenarios without custom engineering.

### One Record Across Your Business

Remarcable connects to Vista via Trimble App Xchange to put the field, purchasing, and accounting teams on the same page.

### A clear path to integration

#### STEP 1

##### We learn how you run your jobs

Before we touch a system, we sit down with your team to understand how you structure jobs, phases, and cost codes. The integration is configured to your workflow, not the other way around.

#### STEP 2

##### We handle the connect setup

Remarcable's engineering team establishes a secure API connection through Trimble App Xchange. Your IT teams involvement is light and time-boxed.

#### STEP 3

##### Your jobs and vendors sync

We sync jobs, phases, cost codes, and vendors from Vista into Remarcable so the field and purchasing teams start every PO with the right data.

#### STEP 4

##### Validation with real transactions

Our team configures field mappings, sync rules, and validation logic - then test it against your actual POs, invoices, and change orders.

#### STEP 5

##### Your AP teams owns it on day one

Hands-on training walks your AP team through processing POs, invoices, and changes orders into Vista.

### App Xchange Details

Remarcable carries the Trimble App Xchange integration end-to-end. No separate license fees, no developer agreement for your team, no API tiers to manage.
